

ELLADRIA LANKA

SEO & Performance Audit

React/Vite codebase and live production review

Production: <https://www.elladria.com/>

Stack: React 18, TypeScript, Vite 5, React Router 6, Tailwind CSS, Supabase, Vercel

Audit date: 4 September 2026

Scope: Routing, metadata, technical SEO, content, search intent, performance, indexing architecture, and security/SEO separation.

Executive summary

Elladria SEO & Performance Audit · 4 September 2026

Elladria has relevant recruitment content and generally sound semantic headings, but it is not yet technically ready for professional organic search acquisition.

SEO readiness: 38/100

- Valid public routes return HTTP 404 when opened directly in production.
- Every route uses the same title and metadata, still branded “EuroBridge Careers.”
- No canonical URLs or XML sitemap exist.
- Admin and authentication pages have no noindex protection.
- Vacancies are client-rendered Supabase cards with no individual job URLs.
- No JobPosting, Organization, or other JSON-LD exists.
- The main JavaScript bundle and several important images are large.

1. Routing

Registered routes

Route	Component/access	Indexing
/	RecruitHome · public	Index
/vacancies	RecruitVacancies · public	Index
/about	RecruitAbout · public	Index
/careers	RecruitCareers · public	Index if substantial/current
/auth	Authentication utility	Noindex
/reset-password	Authentication utility	Noindex
/admin	Authenticated admin role via AdminOnly	Noindex
*	Client NotFound	Noindex; true 404 required

Dormant source pages for dashboards, registration, tickets, events, cohost invitations, unsubscribe, and admin claim are not registered in the current router. If restored, they require explicit access and indexing rules.

Vercel direct navigation

Live request	Elladria SEO & Performance Audit · 4 September 2026	Status
https://www.elladria.com/		200
/about		404
/vacancies		404
/careers		404
Arbitrary unknown route		404

Critical: no Vercel SPA rewrite configuration exists. Internal React Router navigation may work, but refreshes, new tabs, bookmarks, social crawlers, and search crawlers receive 404 for key pages.

The client NotFound route can become a soft 404 if all paths are rewritten to index.html. A robust solution must allow legitimate SPA routes while preserving real 404 behavior for unknown URLs.

2. SEO metadata

Page	Unique title	Description	Canonical	Robots	OG/X
Home	No	Global	Missing	Missing	Partial/global
About	No	Global	Missing	Missing	Partial/global
Vacancies	No	Global	Missing	Missing	Partial/global
Careers	No	Global	Missing	Missing	Partial/global
Auth/admin/404	No	Global	Missing	Missing	Global

The global title is “EuroBridge Careers — European Jobs for Sri Lankans.” The description mentions Romanian truck, factory, and warehouse vacancies. Problems include the old brand, identical metadata on all URLs, author set to Lovable, Twitter account set to @Lovable, no `og:url` or `og:site_name`, and a Lovable-era externally hosted social image.

Correct global basics: UTF-8, `lang="en"`, and a responsive viewport.

Encoding artifacts occur in visible source/output, including currency, punctuation, copyright symbols, arrows, and Romanian city names. Normalize and verify UTF-8 output.

3. Technical SEO

- **robots.txt:** exists and returns 200, but allows every path and has no Sitemap directive.
- **Sitemap:** absent; production `/sitemap.xml` returns 404.
- **Canonicals:** entirely absent.

- **404:** client page exists, but status handling is unreliable under an SPA fallback.
- **HTTPS/www:** HTTPS and www are canonical in live redirects; HSTS is present.
- **Redirect efficiency:** bare HTTP uses two hops; redirect directly to HTTPS www.
- **Trailing slash:** no explicit policy; route style indicates non-trailing-slash canonicals.
- **Favicon:** PNG and ICO files exist; no Apple touch icon, manifest, or theme color.
- **Structured data:** no JSON-LD. Organization, EmploymentAgency/LocalBusiness, WebSite, BreadcrumbList, JobPosting, and eligible FAQ schema are opportunities.

4. Content SEO

Homepage

H1: Your European career starts here.

H2 topics: available opportunities, European expansion, guided journey, and team support. Dynamic H3s describe job categories and process steps.

Primary topic: European employment and support for Sri Lankan job seekers.

Clarity: partial. Recruitment, visas, employers, and Sri Lankan candidates are evident, but the H1 does not identify Elladria, Sri Lanka, Romania, or recruitment.

Links: connect Romania employment copy to vacancies; credentials to About; category cards to filtered or individual job pages.

Vacancies

H1: Opportunities across Europe. Each job title is an H2.

Primary topic: open European jobs, currently centered on Romania.

Clarity: partial. Job details are visible after loading, but the page does not clearly state Elladria's Sri Lankan foreign-employment role in its main headings.

Critical: jobs have no individual URLs and are fetched only after React and Supabase execute. Create stable detail pages with complete fields and contextual links.

About

H1: Bridging Sri Lankan talent with European opportunity.

H2/H3 topics: Elladria, SLBFE registration, vision, mission, leadership, reasons to choose Elladria, commitments, certificates, and purpose.

Clarity: strong. It is the best current explanation of Elladria, but Romania specialization is less explicit than the broader international positioning.

Links: connect foreign-employment and SLBFE sections to vacancies and relevant Romania jobs; link credentials to authoritative verification where available.

Careers

H1: Do meaningful work that opens doors across borders. Open positions is an H2; role titles are H2s.

Primary topic: jobs within Elladria, not overseas placements.

Clarity: partial. Metadata does not distinguish internal careers from overseas vacancies. Add explicit “work at Elladria” positioning and a link to overseas vacancies.

Elladria SEO & Performance Audit - 4 September 2026

Image/heading observations

Most key images have useful alt text and many below-the-fold images are lazy loaded. Main problems are oversized files, absent intrinsic dimensions, no responsive sources, and reusable hero-scale images in small card contexts. Shared footer and booking components add repeated H2/H3 headings to every public page.

5. Search intent

The site reasonably communicates Sri Lankan candidates, European employment, recruitment, visa/travel support, logistics roles, Romania locations, and SLBFE credentials. It does not consistently state the combined proposition: Elladria is a Sri Lankan recruitment/foreign-employment agency helping Sri Lankan job seekers access verified Romania opportunities.

Intent	Current coverage
Romania jobs for Sri Lankans	Partial
Romania job vacancies Sri Lanka	Weak
Jobs in Romania from Sri Lanka	Implied
Romania employment opportunities	Partial
Overseas jobs Romania	Weak
Foreign employment Romania	Split across pages
Romania recruitment agency Sri Lanka	Weak

Create a topic map before rewriting. Assign one primary intent per page and use related terms naturally; do not repeat every phrase on every page.

6. Performance

Asset/output	Approximate size
Production JavaScript	845 KB minified / 248 KB gzip
Production CSS	122 KB / 19.5 KB gzip
career-warehouse.png	2.09 MB
about-us-header.png	1.78 MB
career-logistics.png	1.74 MB
career-airport.png	1.72 MB

- **JavaScript:** active routes are imported synchronously, putting public, auth, and admin code in the initial graph. Use route-level splitting
- **Images:** resize and encode responsive AVIF/WebP; use separate card variants, dimensions, srcset/sizes, and high priority only for the initial LCP image.
- **LCP risk:** multi-megabyte hero PNGs, external fonts, client rendering, and a large bundle.
- **CLS risk:** images without dimensions, font swaps, dynamic Supabase results, and animated hero replacement.
- **INP risk:** large JS, Framer Motion, timers, continuous marquee, providers, and client data work.
- **Fonts:** Google Fonts loads Bricolage Grotesque and DM Sans with many weights, while CSS also references Inter/Manrope. Audit actual usage and consider self-hosted WOFF2.
- **Third party:** Supabase, Google Fonts, lazy Google Maps iframe, and external social preview image. No analytics/advertising scripts were found.
- **Rendering:** marketing pages are entirely client-rendered. Prerendering public pages would improve crawl reliability and initial performance.

7. Indexing architecture

The homepage returns 200. About, Careers, and Vacancies are linked internally but return 404 on direct production requests. No individual vacancy routes exist.

Vacancy crawl chain: request /vacancies → current Vercel 404; after a rewrite, empty #root HTML → JavaScript download/execute → React mount → Supabase query → vacancy cards. Every stage must succeed before a crawler sees a job.

Give each published vacancy a stable slug, canonical URL, complete details, sitemap entry, and JobPosting JSON-LD. Render indexable content in initial HTML. Define expiration behavior for closed jobs.

8. Security and SEO separation

- Admin is protected client-side by authentication and role checks; Supabase RLS is the essential backend protection.
- Apply `noindex`, `nofollow` and preferably X-Robots-Tag to admin, auth, reset, dashboards, invitations, tickets, settings, and user-data pages.
- Never use robots.txt as access control. Continue enforcing authentication, authorization, and RLS.
- Remove or reconsider the public footer's Admin access link.
- Exclude all private routes from sitemaps and split private code from the public bundle.
- Only published/open records should receive indexable URLs. Drafts must not enter HTML, sitemaps, or structured data.

9. Score breakdown

Elladria SEO & Performance Audit - 4 September 2026

Area	Score
Routing and crawl accessibility	4/20
Metadata and social previews	5/15
Technical SEO	6/15
Content quality and semantics	13/20
Vacancy indexing architecture	2/15
Performance/Core Web Vitals readiness	5/10
Security/index separation	3/5
Total	38/100

10. Priority action list

P0 — Critical

Path/area	Problem and impact	Recommendation
Vercel config	Valid public routes return 404; crawlers/new tabs cannot access them.	Add correct SPA rewrites or prerender/SSR, preserving true 404s.
App.tsx / index.html	All URLs share old-brand metadata.	Implement unique route-specific titles, descriptions, OG/X data.
All public routes	No canonicals; duplicate variants are uncontrolled.	Add absolute canonicals under HTTPS www.
Vacancies	No individual job URLs; jobs cannot rank independently.	Create stable crawlable detail routes and JobPosting data.
useVacancies.ts	Jobs appear only after JavaScript and Supabase succeed.	Prerender or server-render published vacancy content.
Admin/auth/reset/404	No noindex controls.	Add noindex/nofollow and server headers where possible.

P1 — High impact

Path/area	Problem and impact	Recommendation
public/	No sitemap; weak URL discovery.	Generate XML sitemap including future published jobs.
robots.txt	No sitemap directive; every route crawlable.	Add sitemap and coordinate with route noindex.
Vacancy schema	Missing slug, dates, structured salary, requirements and location details.	Expand model for complete job pages/schema.
Public site	No structured data.	Add Organization, WebSite, breadcrumbs, and JobPosting JSON-LD.
App.tsx	845 KB monolithic JS bundle.	Lazy-load public/auth/admin route groups.
Hero/About images	1.7–2.1 MB PNGs harm LCP.	Resize; produce responsive AVIF/WebP variants.
Homepage/Vacancies	Primary headings weakly match Romania recruitment intent.	Assign accurate page topics without keyword stuffing.
Source encoding	Corrupted characters damage content quality.	Normalize UTF-8 and verify deployed output.
Public rendering	Initial HTML lacks body content.	Prerender or SSR indexable pages.

P2 — Useful

Elladria SEO & Performance Audit · 4 September 2026		
Path/area	Problem and impact	Recommendation
index.html	Incomplete/wrong social metadata.	Add unique Elladria OG/X fields and owned images.
RecruitLayout.tsx	EuroBridge labels and generic social links remain.	Standardize Elladria identity; link verified profiles.
Images	Missing dimensions and responsive sources.	Add intrinsic size, srcset, and sizes.
Fonts	Render-blocking Google fonts and possible family mismatch.	Remove unused weights/families or self-host.
Careers	Internal hiring intent is not distinct from overseas vacancies.	Use explicit “work at Elladria” metadata and cross-links.
NotFound.tsx	Soft-404 risk and minimal recovery navigation.	Preserve status, add noindex and useful links.
Redirects	Bare HTTP uses two hops.	Redirect directly to HTTPS www.

P3 — Optional

Path/area	Problem and impact	Recommendation
public/index.html	No manifest, touch icon, or theme color.	Add if richer install/share presentation is desired.
robots.txt	Redundant per-bot allow groups.	Simplify to a maintainable wildcard policy.
Content strategy	No evergreen Romania information architecture.	Consider factual eligibility/process/safety guides.
About	Leadership/entity relationships are implicit.	Add truthful Organization/Person data where useful.
Dependencies	Dormant event-platform dependencies add complexity.	Review after confirming long-term product scope.
Social preview	Asset resides on a Lovable-era third-party URL.	Host an optimized Elladria image on the main domain.

This report is an audit and recommendation document. No website source files, dependencies, or deployment configuration were modified as part of the audit itself.
